

The Jiggly Guide

Brief project introduction

Jiggly (GLY) is an on-chain composer that rewards collective decision-making and aims to make trading fun and collaborative. **You vote by selling the GLY tokens** in registered Uniswap V2 Liquidity Pools.

Jiggly maps all trades within 30-minute **segments** to a musical command for a Game Boy-like sound synthesizer.

This guide will walk you through a 6-step process, on how to take part in the composition and earn rewards.

Step 1.: Wrap your ETH

Voting with Jiggly is done by using wrapped tokens to make sure that voting is fair and that a certain volume of tokens is only traded once every segment. **The wrapped tokens prevent those who voted from transferring them until the segment expires.** Otherwise, there are no limits on wrapping/unwrapping.

Head over to <https://wrap.jiggly.app> to wrap or unwrap WGLYETH tokens.

Jiggly wrapper

▶ Wrap

Unwrap

0.006 ETH

0x3a...58fF6b

Amount

2648

balance: 2648.3249

APPROVE

make sure you're on
<https://wrap.jiggly.app>

Jiggly wrapper

▶ Wrap

Unwrap

0.006 ETH

0x3a...58fF6b

Amount

2648

balance: 2648.3249

SEND TRANSACTION

make sure you're on
<https://wrap.jiggly.app>

You first need to approve spending.

Step 2.: Buy GLY

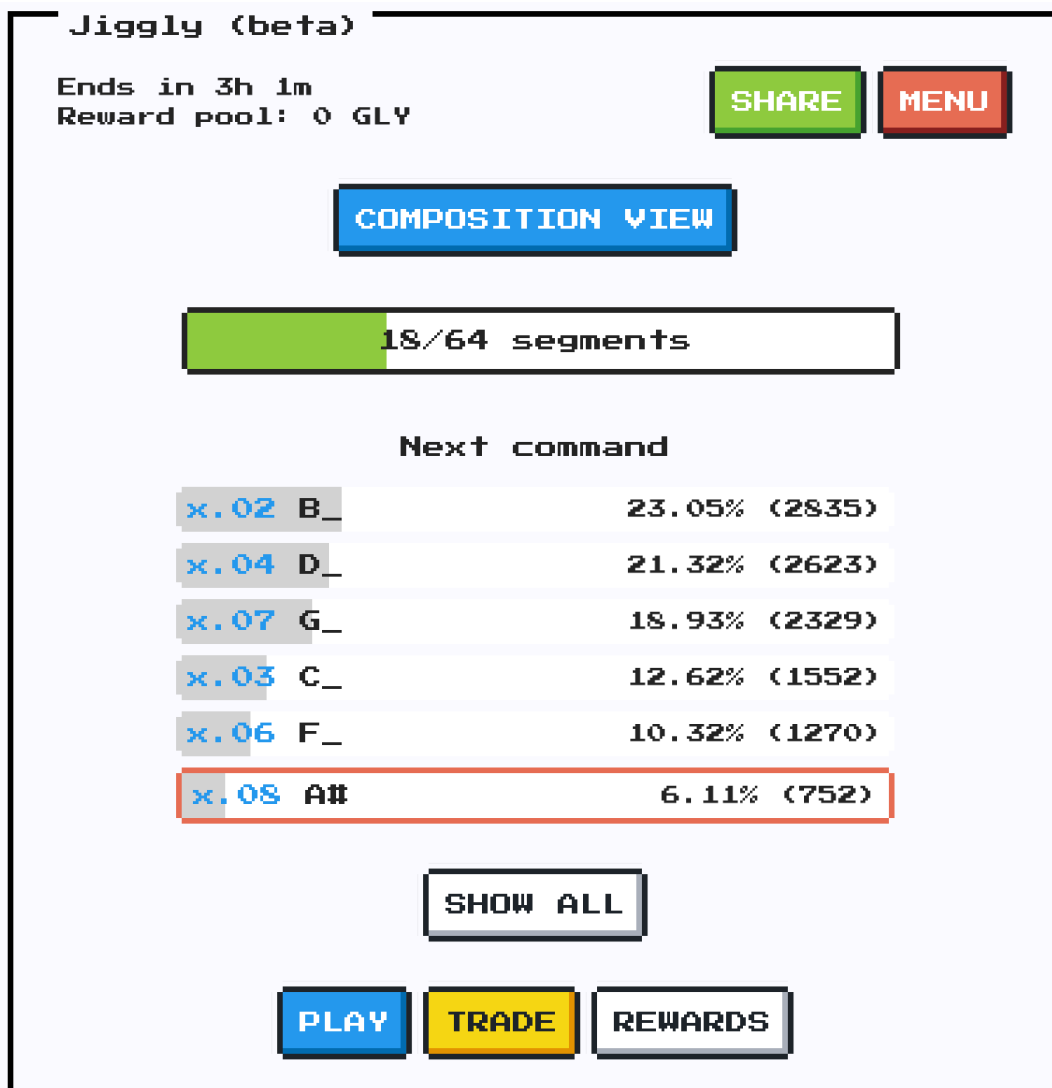

You will vote by selling GLY, therefore you need to buy some first from the Uniswap LP

- GLY: 0x788362745CBa78A2E5F02469975B78F25cC599ac
- WGLYETH: // TBD

(you can also use the in-app TRADE button to select the correct tokens safely)

Step 3.: Load the app

Go to <https://jiggly.app/#app>. Once loaded you should see a screen similar to this:

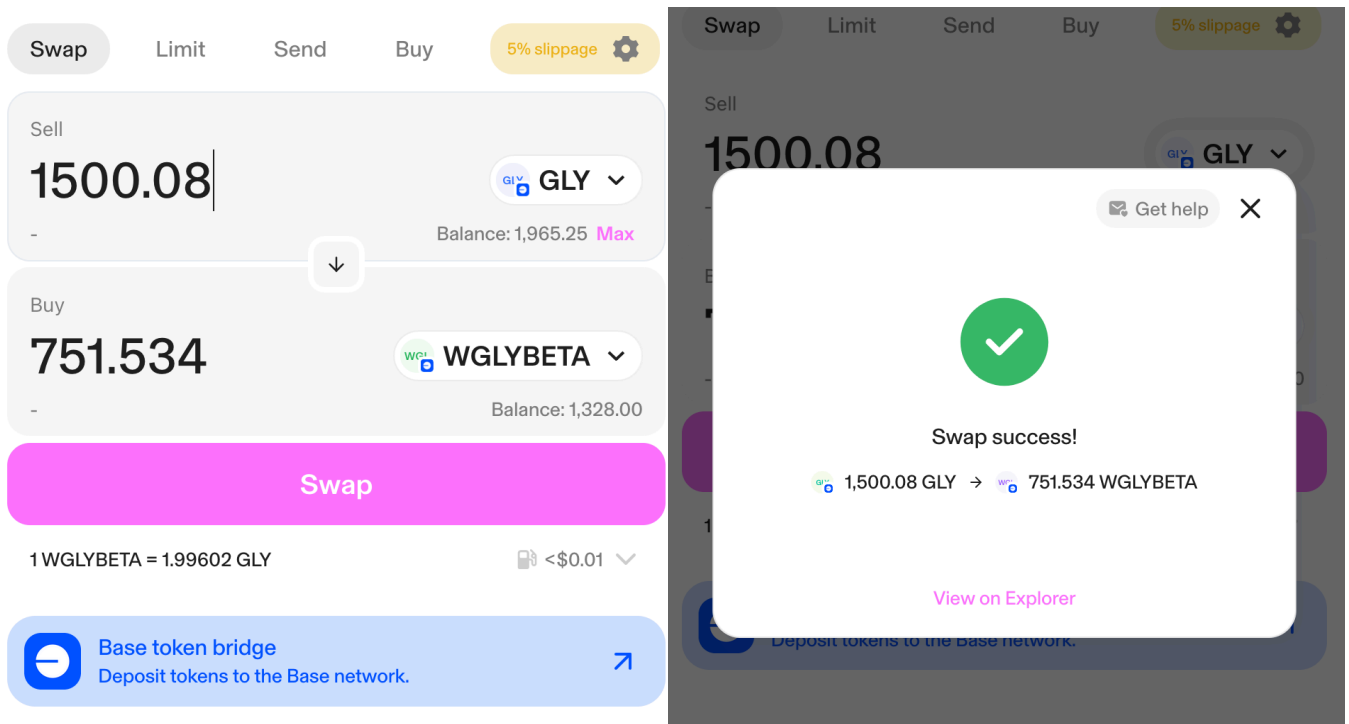

We are only interested in the **Next command** section for now. The highlighted command is **A#** (**with 752 votes**) indicating that it should be the one on top (with the most votes) in the current composition.

Next to A# is the number **x.08**. Take note of this as it will be important for the next step.

Step 4.: Sell GLY and specify the decimal value of your trade to vote

To vote, open up Uniswap (<https://app.uniswap.org>) on **BASE** and set the correct token pair. (or simply click the TRADE button in the app).

To give votes to A# we need to specify its ID (from the previous step: **x.08**) as the **decimal value of your trade** like this:

Your trade will only be considered as a valid vote, if you specify the decimal value of your trade to the option indicated in the app.

Vote strength calculation

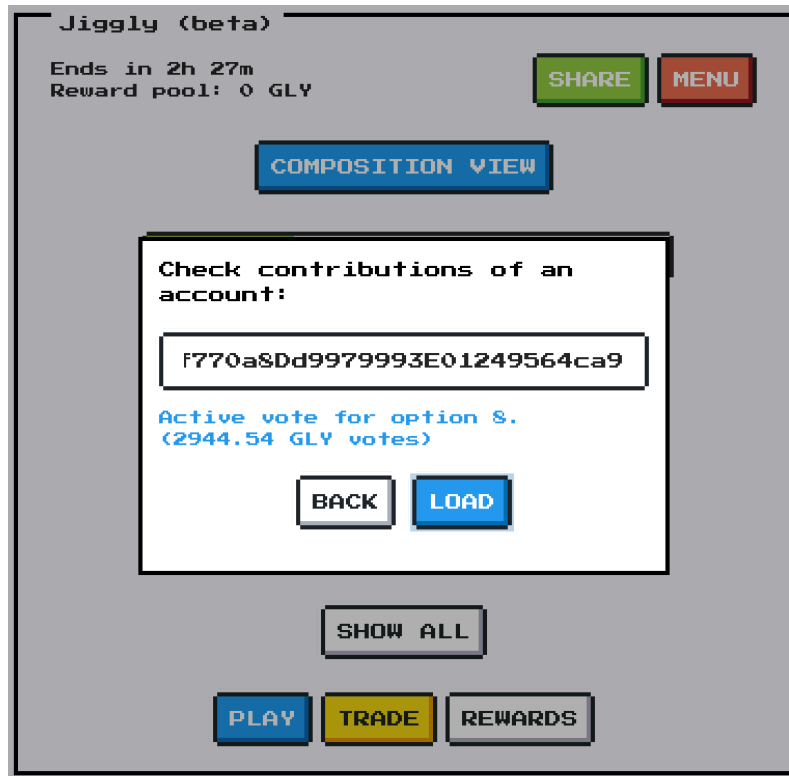

The strength of your vote depends on the number of tokens you exchange and how much time has passed since the segment began. The sooner you cast your vote in a segment, the more it counts - but your WGLYETH is locked for longer - according to the chart on the right.

The X-axis represents time, with 1 being the end of the segment, while the Y-axis is the vote multiplier.

Step 5.: Make sure everything worked

You can then check in-app if your vote went through successfully, by putting your address into the REWARDS button dialog.

Step 6.: Claiming rewards

If the option you voted for gets selected at the end of the segment you are eligible for your share of the reward pool. Simply cast a valid vote in the next immediate segment to claim it. (Step 4) If you don't claim your vote in the next segment, they will be lost.

You can vote multiple times during a segment, but only your last contribution will be considered for rewards.

The amount of rewards depends on the volume traded during the segment and the amount of tokens present in the reward contract.

Further reading

You can find more detailed information about the token in the whitepaper:

FAQ

What do I need to play Jiggly?

An ETH wallet with some BASE ETH tokens and a basic knowledge of Uniswap. Your best starting point is this guide.

How does Jiggly compose music on-chain?

The smart contract emits **Segment** events with the respective selected options. These options are then piped into a composer that translates them into musical commands.

Is there a fee for using Jiggly?

Every GLY transfer takes 0.5% volume and transfers it to the reward pool. This is aimed at replenishing the pool so that there will always be enough tokens.

How to wrap/unwrap ETH?

Head over to <https://wrap.jiggly.app>, select the amount, approve, and send the transaction, to unwrap, simply select the unwrap option, specify your amount, and send the transaction. (it will also tell you how many tokens you currently have locked, if any)

How do I know which option to vote for?

The next option in the current composition is always highlighted in the Jiggly DApp. It's green if it's the currently provisional winner, and red otherwise.

I've just voted but the app said I didn't, what can I do?

Wait for a few more seconds, try to reload the app, if it still doesn't show up, make sure to specify the correct decimal value in your trade when selling GLY. (to cast 100 votes for option x.04 you need to sell 100.04 GLY precisely)

I get the dreaded "swap failed" message after voting, is this a scam?

Certainly not, if you vote successfully, the wrapped tokens you receive will be locked until the end of the segment for voting security. (you can check the number of currently locked tokens if you go to the **unwrap** screen at <https://wrap.jiggly.app>)

If you get a "swap failed" otherwise, you can try to either wait a few seconds, reload Uniswap, adjust slippage, make a tea or coffee, and if it still doesn't work, reach out to theduck@jiggly.app for further troubleshooting.

I've voted, but for the wrong option, how do I change my vote?

If you still have GLY tokens left in your wallet, you can vote again and your latest contribution will be considered for rewards.

How do I collect my rewards?

Your rewards are automatically sent to you if you cast a vote in the following segment. (if you don't, they are forfeited). This next vote can be for any value (1.01 GLY will always work).

The app says "composition failed", what does it mean?

It means, that an option which was not part of the desired composition has been selected. The community can try to fix the issue - unless the command was a *note* command - or abandon the composition and start over.

How do non-vote swaps influence the composition?

Any non-vote swap (**in fact any GLY token movement**) removes votes from the current provisionally selected option and adds them to another random one - to the value of 20% of the amount of GLY transferred. This creates random noise that participants must take into account and try to work against.
